

Part E: Business Findings

Author: GORDON MOENGA

Finding 1: The business has a high transaction success rate

Finding: Most transactions are completed successfully.

Evidence: The dashboard shows 12,000 total transactions, with a transaction success rate of 90.47%.

Validation: The evidence supports the original finding because more than 90% of transactions are successful.

Business Meaning: The high success rate indicates that the transaction process is generally working well. However, the remaining unsuccessful transactions still represent a potential loss of sales and customer activity.

Conclusion: The finding is supported by the evidence.

Finding 2: A significant proportion of transactions require risk review

Finding: Risk review is an important issue within the transaction process.

Evidence: 19.60% of transactions are flagged for risk review.

Validation: The evidence supports the finding. Almost one in five transactions requires additional risk attention, which is large enough to be considered a significant operational issue.

Business Meaning: A high-risk review rate may increase processing time and could affect customer experience. It also shows the need to understand which transaction types, channels, or customer groups contribute most to the reviews.

Conclusion: The finding is supported by the evidence.

Finding 3: The business processes a large transaction value

Finding: The business handles a substantial overall transaction value.

Evidence: The dashboard records a total transaction value of approximately NGN 585.88 million across 12,000 transactions. The average transaction value is approximately NGN 48.82 thousand.

Validation: The evidence supports the finding because the total transaction value is substantial and the average transaction value shows that transactions are not limited to very small amounts.

Business Meaning: Because the business processes a large amount of value, improving transaction success and managing risk effectively can have a meaningful financial impact.

Conclusion: The finding is supported by the evidence.

Finding 4: Customer activity is spread across a large customer base

Finding: The business serves a sizeable customer base.

Evidence: The dashboard contains approximately 1,500 customers across the 12,000 recorded transactions.

Validation: The evidence supports the finding. The transaction data covers a large number of customers rather than being concentrated in only a few customer records.

Business Meaning: This provides an opportunity to analyse customer behaviour and identify which customer groups generate the most transactions and value.

Conclusion: The finding is supported, but further customer segmentation is needed to identify the most valuable customer groups.

Finding 5: Transaction performance should be examined across time and transaction characteristics

Finding: Overall transaction results alone are not enough to explain business performance.

Evidence: The dashboard includes transaction trends, transaction types, channels, customer segments, and risk review measures. Overall performance is strong, with a 90.47% success rate, but 19.60% of transactions still require risk review.

Validation: The evidence supports the need for a more detailed analysis. The overall success rate can hide differences between transaction types, channels, customer segments, and other categories.

Business Meaning: Management should not rely only on overall transaction performance. Understanding where unsuccessful or risk reviewed transactions occur can help target improvements more effectively.

Conclusion: The original finding should be refined from looking only at overall performance to comparing performance across important transaction characteristics.
