

Part F: Management Recommendations

Author: GORDON MOENGA

Recommendation 1: Reduce unsuccessful transactions

Finding: The transaction success rate is 90.47%.

Evidence: Out of 12,000 transactions, 90.47% are successful, meaning a noticeable proportion are unsuccessful.

Business Implication: Unsuccessful transactions can result in lost business opportunities and may negatively affect customer experience.

Recommended Action: Management should investigate the main reasons for unsuccessful transactions and focus improvement efforts on the transaction types and channels with the lowest success rates.

Recommendation 2: Improve risk review processes

Finding: A significant proportion of transactions require risk review.

Evidence: 19.60% of transactions are flagged for risk review.

Business Implication: A high review rate can increase processing time and place additional pressure on risk and operations teams.

Recommended Action: Analyse risk review rates by transaction type, channel, customer segment, and international status. Management should then focus review resources on the categories with the highest risk rates.

Recommendation 3: Monitor high value transactions closely

Finding: The business processes a substantial transaction value.

Evidence: Total transaction value is approximately NGN 585.88 million, with an average transaction value of approximately NGN 48.82 thousand.

Business Implication: Problems affecting high value transactions can have a larger financial impact than problems affecting lower value transactions.

Recommended Action: Management should monitor high value transactions separately and combine transaction value with risk review and success measures to identify areas that need closer attention.

Recommendation 4: Use customer analysis to improve decision making

Finding: The transaction data covers approximately 1,500 customers.

Evidence: 12,000 transactions are associated with a sizeable customer base of approximately 1,500 customers.

Business Implication: Customer level analysis can help management understand which customer groups generate the most activity and transaction value.

Recommended Action: Segment customers based on transaction activity and value, then use these segments to guide customer retention, service improvement, and targeted business strategies.

Recommendation 5: Track performance by transaction characteristics

Finding: Overall transaction performance does not show where problems are concentrated.

Evidence: The overall success rate is 90.47%, while 19.60% of transactions require risk review. The dashboard also allows analysis by transaction type, channel, customer segment, and international status.

Business Implication: Different parts of the transaction process may perform differently even when the overall business results appear strong.

Recommended Action: Management should regularly compare success and risk review rates across transaction types, channels, customer segments, and international transactions. This will allow resources and improvement efforts to be directed toward the areas with the weakest results.
