Part D: Final Business Insights

1. Everyday Customers Form the Largest Customer Segment

Finding: Everyday customers represent the largest segment of FinTrust's customer base.

Evidence: The dataset contains 711 Everyday customers out of 1,500, representing 47.4% of all customers. They generated 5,644 transactions with a total value of approximately NGN 261.46 million.

Business Meaning: Everyday customers account for a substantial share of the bank's customer activity and transaction value. Their needs are important when planning customer services and engagement strategies.

Recommended Action: Maintain reliable services for Everyday customers while exploring opportunities to improve engagement and encourage appropriate use of other banking services across all segments.

2. Transfers Drive Transaction Activity and Value

Finding: Transfers are the most active transaction type and generate the highest total transaction value.

Evidence: Transfers accounted for 3,549 transactions worth approximately NGN 237.92 million. Deposits had the highest average transaction value, at approximately NGN 98,633 per transaction.

Business Meaning: Transfers are central to FinTrust's transaction activity, while deposits contribute substantial value per transaction. These services have different roles in the bank's operations.

Recommended Action: Monitor transfer performance and reliability closely, while maintaining effective processing and monitoring for deposits and other transaction types.

3. Mobile App Performance Requires Further Investigation

Finding: The Mobile App is the most frequently used channel but has the lowest transaction success rate among the five channels.

Evidence: The Mobile App processed 5,102 transactions worth approximately NGN 240.10 million, with a success rate of 89.75%. ATM had the highest success rate at 91.70%.

Business Meaning: Because the Mobile App handles the greatest transaction volume and value, unsuccessful transactions on this channel may affect a substantial number of customers.

Recommended Action: Investigate unsuccessful Mobile App transactions by failure reason, transaction type, and time period. Use the results to identify opportunities to improve reliability and customer experience.

4. International Transactions Have a Higher Risk Review Rate

Finding: International transactions are flagged for risk review more frequently than domestic transactions.

Evidence: International transactions had a risk review rate of 36.88%, compared with 18.88% for domestic transactions. There were 480 international transactions and 11,520 domestic transactions.

Business Meaning: International transactions show a higher proportion of risk reviews, although domestic transactions account for more reviews in absolute numbers because their volume is much larger.

Recommended Action: Investigate the factors associated with international transaction reviews, including transaction amounts, transaction types, and channels. Avoid treating an international transaction as suspicious based on international status alone.

5. Transfers and Cash Withdrawals Have Higher Risk Review Rates

Finding: Risk review rates differ considerably across transaction types, with transfers and cash withdrawals recording the highest rates.

Evidence: Transfers had a risk review rate of 28.49%, followed by cash withdrawals at 25.31%. Bill payments recorded the lowest rate at 12.81%.

Business Meaning: These differences suggest that transaction type may be relevant when investigating risk review patterns. However, a risk review flag does not establish that a transaction is fraudulent.

Recommended Action: Examine the characteristics of reviewed transfers and cash withdrawals to understand the patterns behind the higher rates. Use the findings to support evidence-based risk monitoring.

6. SMEs Generate the Highest Transaction Value per Active Customer

Finding: SMEs have the highest average total transaction value per active customer among the four customer segments.

Evidence: SMEs generated approximately NGN 387,923 per active customer, followed by Students at NGN 386,604, Everyday customers at NGN 367,734, and Premium customers at NGN 365,258.

Business Meaning: Although Everyday customers generate the highest total value, SMEs contribute more value per active customer on average. Looking at customer-level measures provides a more complete view of segment performance.

Recommended Action: Investigate the banking needs of SME customers and explore suitable services that support their transaction activity. Compare service costs and customer needs before making investment decisions.

7. Transaction Activity Recovered in March

Finding: Transaction volume and total transaction value declined in February before recovering in March.

Evidence: Transaction volume fell from 4,133 in January to 3,734 in February, then rose to 4,133 in March. Total transaction value increased from approximately NGN 175.79 million in February to NGN 196.20 million in March. The success rate remained around 90% each month.

Business Meaning: Transaction activity fluctuated over the three-month period, while the success rate remained relatively stable. The available data does not explain why February activity declined.

Recommended Action: Continue monitoring monthly activity and investigate future declines to determine whether they are associated with customer behaviour, seasonal patterns, or operational factors.
