

Business Findings

Author: Gordon Moenga

1. Everyday customers make up the largest customer segment

Finding:

The Everyday segment is FinTrust's largest customer group, with **711 customers**, representing the largest share of the 1,500 customers.

Evidence:

Everyday: 711

Premium: 295

Student: 278

SME: 216

Business Meaning:

The Everyday segment represents a major part of FinTrust's customer base. Understanding its transaction behaviour can therefore provide useful insight into overall customer activity.

2. Transfers generate the highest transaction activity and value

Finding:

Transfers are the most common transaction type and generate the highest total transaction value.

Evidence:

There were 3,549 transfers, with a total value of approximately NGN 237.92 million.

Business Meaning:

Transfers are an important part of FinTrust's transaction activity. Monitoring transfer behaviour can help the bank better understand where much of its transaction activity and value comes from.

3. Mobile App is the main transaction channel

Finding:

The Mobile App recorded the highest transaction activity and transaction value among the available channels.

Evidence:

The Mobile App recorded 5,102 transactions with a total value of approximately NGN 240.10 million.

Business Meaning:

The Mobile App is a key channel for FinTrust customers. Its high transaction activity makes the channel important for monitoring customer usage and transaction performance.

4. Transaction performance is generally high, but varies slightly by channel

Finding:

Overall transaction success was 90.47%, although success rates differed across channels.

Evidence:

ATM had the highest success rate at 91.70%, while the Mobile App had the lowest at 89.75%.

Business Meaning:

Most transactions are completed successfully, but the differences between channels provide an opportunity to investigate unsuccessful transactions and identify possible causes of failed transactions.

5. International transactions have a higher risk review rate

Finding:

International transactions had a substantially higher risk review rate than non-international transactions.

Evidence:

International transactions: 36.88%

Non-international transactions: 18.88%

Business Meaning:

International transaction status appears to be an important factor associated with risk reviews in this dataset. This makes it a useful variable to consider in further risk analysis and predictive modelling.

6. Risk review rates vary considerably by transaction type

Finding:

Transfer and Cash Withdrawal transactions had the highest risk review rates.

Evidence:

Transfer: 28.49%

Cash Withdrawal: 25.31%

Deposit: 16.19%

Airtime/Data: 15.19%

Card Purchase: 13.02%

Bill Payment: 12.81%

Business Meaning:

The difference in risk review rates suggests that transaction type may be associated with risk review patterns. These differences can be investigated further during the risk modelling stage.

7. Customer transaction frequency is similar across segments

Finding:

The average number of transactions per customer is fairly similar across all customer segments.

Evidence:

Student customers had the highest average at 8.23 transactions per customer, while SME customers had the lowest at 7.90.

Business Meaning:

The size of a customer segment does not necessarily indicate how frequently individual customers transact. Comparing customer activity on a per customer basis provides a clearer understanding of behaviour across segments.
