Executive Summary

This report presents an analysis of SwiftLog Logistics' business intelligence dashboards, focusing on revenue performance, customer activity, inventory management, warehouse operations, supplier performance, delivery efficiency and product returns.

The dashboards indicate total revenue of ₦7.11 million, approximately 5,000 orders and shipments, 1,000 customers, and 150 suppliers. Lagos is the leading revenue-generating region, contributing ₦3.86 million (54.26%) of total revenue, followed by Abuja at ₦1.82 million (25.56%) and Kano at ₦1.44 million (20.17%). The business also reports 991 active customers and 951 repeat customers, highlighting the importance of maintaining customer relationships and service quality.

Delivery performance is a key area requiring management attention. The dashboards show that 36.28% of shipments are delayed, while 63.72% are delivered on time. The average delivery delay is 3.57 days. Additionally, 500 returned items are recorded, with wrong items accounting for 37% of returns, damaged items for 32.6%, and late delivery for 30.4%. These findings highlight opportunities to improve delivery planning, order accuracy, product handling and logistics coordination.

Inventory is valued at ₦83.80 million, and the dashboards identify ten low-stock products requiring continued monitoring. However, the available reports do not provide sufficient detail to conclusively rank warehouse efficiency, supplier consistency, product-specific return rates or regional delivery delays.

Based on these findings, the report recommends improving delivery reliability, strengthening inventory controls, reducing preventable returns, introducing warehouse and supplier performance scorecards, and enhancing performance monitoring. SwiftLog should also protect its strong revenue base in Lagos while evaluating sustainable growth opportunities in Abuja and Kano. Implementing these measures will support better operational control, improved customer satisfaction and more informed strategic decision-making.

Business Analysis & Data Storytelling

1. **Products Generating the Highest Revenue:**

The dashboard identifies P085, P234, P025, P220, P035, P172, P140, P229, P162 and P062 among the top ten products by total revenue. P085 generates approximately NGN 187,000 based on the chart scale. Total reported revenue is NGN 7,113,401.88, with the Food category contributing the reported revenue.

2. **Customers Contributing the Highest Revenue:**

The top ten customers displayed are C0924, C0300, C0907, C0229, C0512, C0581, C0597, C0628, C0773 and C0466. SwiftLog reports approximately 1,000 total customers, 991 active customers and 951 repeat customers. These figures indicate a substantial repeat-customer base, although the exact revenue contribution of each leading customer requires verification.

3. **Most Efficient Warehouses:**

Warehouse W07 handles the highest number of orders, at approximately 370, while W13 handles the fewest, at approximately 280. W12 has the highest displayed stock level, while W01 has the lowest.

4. **Suppliers Consistently Performing Well:**

The company reports 150 suppliers. However, the supplied dataset does not provide sufficient supplier-level delivery, quality, defect or fulfilment metrics to identify the most consistent suppliers. A supplier performance scorecard should be introduced to support this assessment.

5. **Products with the Highest Return Rates:**

SwiftLog records 500 returned items. The leading return reasons are wrong items, accounting for 185 returns (37%); damaged items, accounting for 163 returns (32.6%); and late delivery, accounting for 152 returns (30.4%). Product-specific return rates cannot be determined without comparing returns against units sold for each product.

6. **Regions Experiencing the Most Delayed Deliveries:**

Lagos has the highest displayed shipment volume, followed by Abuja and Kano. However, the chart does not clearly separate delayed deliveries from all deliveries by region.

7. **Months Recording Peak Business Activity:**

August is the strongest month shown, with approximately NGN 1.00 million in revenue and 654 orders. September drops to approximately NGN 0.19 million and 154 orders.

8. **KPIs Requiring Immediate Management Attention:**

- Delayed deliveries: 36.28% of shipments are reported as delayed.
- Average delivery delay: 3.57, with the unit needing confirmation.
- Returned items: 500 items, with late delivery the largest recorded return reason.
- September revenue and orders: Both decline sharply compared with August.
- Inventory: NGN 83.80 million in reported inventory value, requiring stock availability and turnover monitoring.
- KPI consistency: The delivery page displays approximately 4K delayed deliveries, while the status chart shows about 1.81K delayed shipments. These figures need reconciliation.

9. **Operational Inefficiencies Identified:**

The following areas require to be investigated:

- High delayed-delivery share of 36.28%.
- Late delivery accounting for 37% of returned items.
- Wrong items and damaged products accounting for a combined 63% of returns.
- Uneven order volumes across warehouses.
- Products with comparatively low stock levels that may face replenishment pressure.
- A sharp September decline that may reflect an operational change or incomplete reporting.
- Conflicting delayed-delivery KPI values that reduce confidence in the dashboard.

10. **Business opportunities for SwiftLog**

- Improve delivery reliability and customer satisfaction.
- Protect revenue from high-value customers through dependable fulfilment.
- Maintain availability of high-revenue products.
- Improve warehouse capacity planning using order and stock data.
- Reduce returns through better picking, packing and delivery handling.
- Build supplier scorecards to strengthen procurement decisions.
- Use monthly trends to plan stock, labour and logistics capacity.
- Improve management reporting through consistent KPI definitions and data validation.

Business Recommendations

- Prioritise service quality and retention for high-value customers, while checking their order frequency, profitability and delivery experience.
- W07 is the highest-volume warehouse, but the dashboard does not provide enough evidence to confirm which warehouse is most efficient. SwiftLog should compare delivery speed, fulfilment accuracy, operating cost and orders processed per employee across warehouses.
- Introduce supplier scorecards covering on-time deliveries, product quality, fulfilment rates and lead-time consistency. With 150 suppliers reported, consistent measurement would help identify reliable partners and address recurring supply problems.
- Introduce barcode-based picking verification, improved packaging standards and systematic return-reason analysis. Wrong items account for 37% of returns, while damaged items account for 32.6%.
- Establish weekly KPI reviews covering on-time delivery, average delay, returns, inventory availability, revenue and customer retention. Assign an accountable manager and measurable target to each KPI.
- Protect Lagos, which generates 54.26% of reported revenue, while evaluating customer acquisition and service expansion in Abuja and Kano. Expansion decisions should consider profitability, delivery capacity and regional demand.
- Introduce delivery service-level targets, dispatch schedules and automated exception alerts. The current 36.28% delayed-delivery rate and 3.57-day average delay demonstrate the need for improvement.
- Establish reorder points and safety-stock levels for individual products. The dashboard identifies ten low-stock products with a combined stock total of 66,486 units, highlighting the need for SKU-level inventory monitoring.
- Monitor cost per shipment, failed deliveries, repeat delivery attempts and return-handling expenses. Reducing delays and preventable returns should be a priority, although the financial savings must be quantified using cost data.
- Management should prioritise delivery reliability, return reduction, September data validation and the accuracy of operational KPIs.
- Prepare inventory and staffing for high-demand periods. Investigate September's sharp decline to determine whether it reflects incomplete data, seasonality or a genuine drop in business activity.
